

Magical Power of Transition Metals: Past, Present, and Future

Ei-ichi Negishi, Purdue University

How to Synthesize Any Organic Compounds in High Yields, Efficiently, Selectively, Economically, Safely

YES (ES) !

Green Chemistry

1. Consider all usable elements (ca. 70).

Avoid (i) radioactive, (ii) inert, and (iii) inherently toxic elements.

2. If desirable and necessary, consider their binary combinations (ca. 5,000). *(Two is Better than One!)^a*

3. Use metals for desirable reactivities.

4. Use transition metals mainly as catalysts.

^a E. Negishi, *CEJ* 1999, 5, 411-420.

Anatomy of the Periodic Table

The periodic table is divided into several color-coded regions:

- He**: Helium (top right)
- Organic elements** (green): Carbon, Nitrogen, Oxygen, Fluorine, Neon.
- Main group metals** (blue): Hydrogen, Lithium, Sodium, Potassium, Rubidium, Cesium, Beryllium, Magnesium, Calcium, Strontium, Barium, Boron, Aluminum, Gallium, Indium, Zinc, Cadmium, Mercury, Silicon, Tin, Bismuth, Phosphorus, Sulfur, Selenium, Tellurium, Iodine, Neon, Argon, Krypton, Xenon.
- d-Block transition metals** (yellow): Titanium, Vanadium, Chromium, Manganese, Iron, Cobalt, Nickel, Copper, Zirconium, Niobium, Molybdenum, Technetium, Ruthenium, Rhodium, Palladium, Silver, Hafnium, Tantalum, tungsten, Rhenium, Osmium, Iridium, Platinum, Gold.
- f-Block transition metals** (orange): Lanthanum, Cerium, Praseodymium, Neodymium, Promethium, Samarium, Europium, Gadolinium, Thulium, Dysprosium, Holmium, Erbium, Thulium, Ytterbium, Lutetium, Actinium, Thorium, Protactinium, Uranium, Neptunium, Plutonium, Americium, Curium, Bk, Cf, Es, Fm, Md, No, Lr.
- Inert gases** (white): Helium, Neon, Argon, Krypton, Xenon.
- Radioactive elements** (red): Rutherfordium, Dubnium, Seaborgium, Bohrium, Hassium, Meitnerium, Ununnilium.
- Intrinsically toxic (?)** (pink/red): Beryllium, Magnesium, Calcium, Strontium, Barium, Zinc, Cadmium, Mercury, Tin, Bismuth, Phosphorus, Sulfur, Selenium, Tellurium, Iodine, Lead, Polonium, Astatine, Radon.

= Radioactive elements (26)

= Organic elements
(12 - 1 = 11)

= Main group metals (27 - 6 = 21)

= Intrinsically toxic (?) (7)

= d-Block transition metals (24 - 1 = 23)

= Inert gases (5)

= f-Block transition metals (15 - 1 = 14)

**58 metals usable
in Organic Synthesis**

Scope and Limitations of Uncatalyzed Cross-Coupling with Grignard Reagents and Organoalkali Metals

	R^1M	$+ R^2X$	$\xrightarrow{\text{No Catalyst}}$	R^1-R^2	$+ M-X$	($M = Mg, Li, \text{etc.}$)
$\begin{array}{c} R^2X \\ \diagdown \\ R^1M \end{array}$	ArX	$\begin{array}{c} \diagup \\ X \end{array}$	$\equiv X$	$\begin{array}{c} \diagup \\ X \end{array}$	$Ar \begin{array}{c} \diagup \\ X \end{array}$	$\begin{array}{c} \diagup \\ X \end{array}$
ArM						
$\begin{array}{c} \diagup \\ M \end{array}$	<ul style="list-style-type: none"> These reactions do not proceed except in special cases. 		<ul style="list-style-type: none"> Some work but they are of limited scope. 			
$\equiv M$						
$\begin{array}{c} \diagup \\ M \end{array}$						
$Ar \begin{array}{c} \diagup \\ M \end{array}$						
$\begin{array}{c} \diagup \\ M \end{array}$						
$Alkyl\ M$						
$N \equiv C - M$						
$\begin{array}{c} \\ C=C-O \\ \end{array} M$						

Note: Cu-promoted and Cu-catalyzed reactions have provided some satisfactory procedures.
Conventional Wisdom: Avoid Cross-Coupling! But, should we?

LEGO Game Approach to C—C Bond Formation

via Pd-Catalyzed Cross-Coupling Reactions

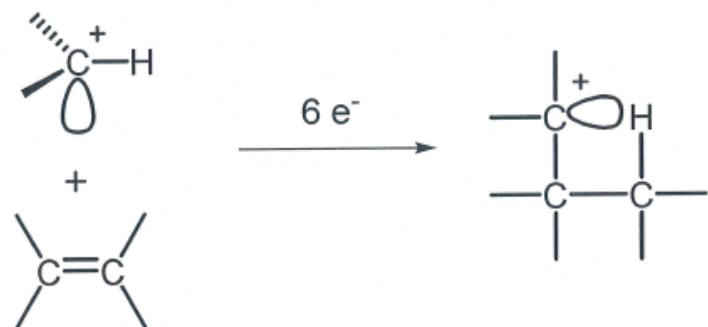

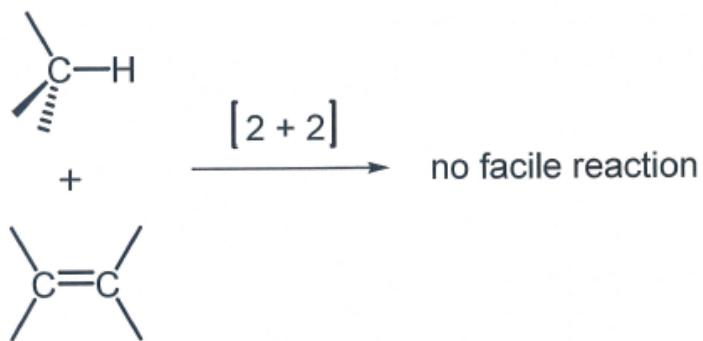

$R^1, R^2 = \text{C group. See below. } M = \text{Mg, Zn, B, Al, In, Si, Sn, Cu, Mn, Zr, etc. } X = \text{I, Br, Cl, F, OTs, OTf, etc.}$

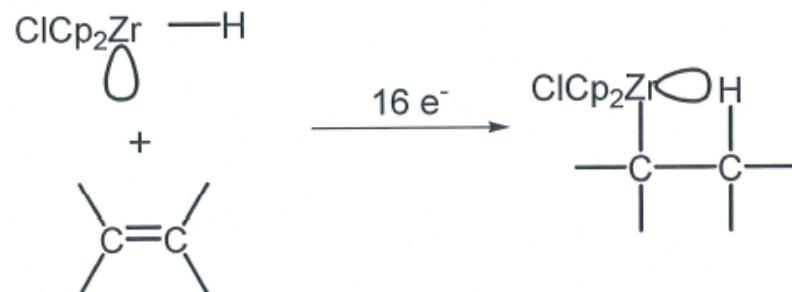

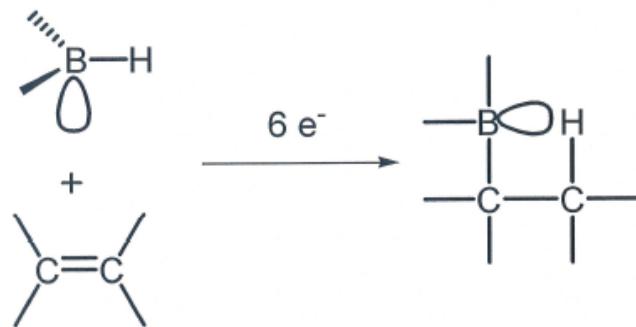

M & X = Regio- & stereo-specifiers, which permit a genuine LEGO Game avoiding addition-ELIMINATION !!!

R^1M	ArX	$\begin{array}{c} \diagup \\ R^2X \end{array}$	$\begin{array}{c} \diagdown \\ X \end{array}$	$\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} X$	$\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} X$	$\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} X$	$\begin{array}{c} \diagup \\ Ar \\ \diagdown \end{array} X$	$\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} X$	$AlkylX$	$RCOX$
ArM					$ArM + \begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} X$				Little known until recently	
$\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} M$				$\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} M + \begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} X$					Recent results promising	
$\equiv M$				$\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} M + \begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} X$		Recently developed Satisfactory				
$\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} M$									Consider also uncatalyzed and Cu-, Ni-, or Fe-catalyzed processes	
$Ar-M$										
$\equiv \begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} M$

$N \equiv C - M$				$\left[\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} M \right] + \left[\begin{array}{c} \diagup \\ \equiv \\ \diagdown \end{array} X \right]$						
$\begin{array}{c} \\ C=C-O \\ \end{array} M$					$Tsuji-Trost$ Reaction		$Tsuji-Trost$ Reaction			
				Use of α -haloenones as enolate equivalents should be considered						

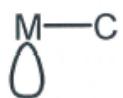

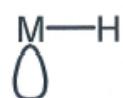

Why Metals?

C^+ -- short-lived, uncontrolled

Bottom line:

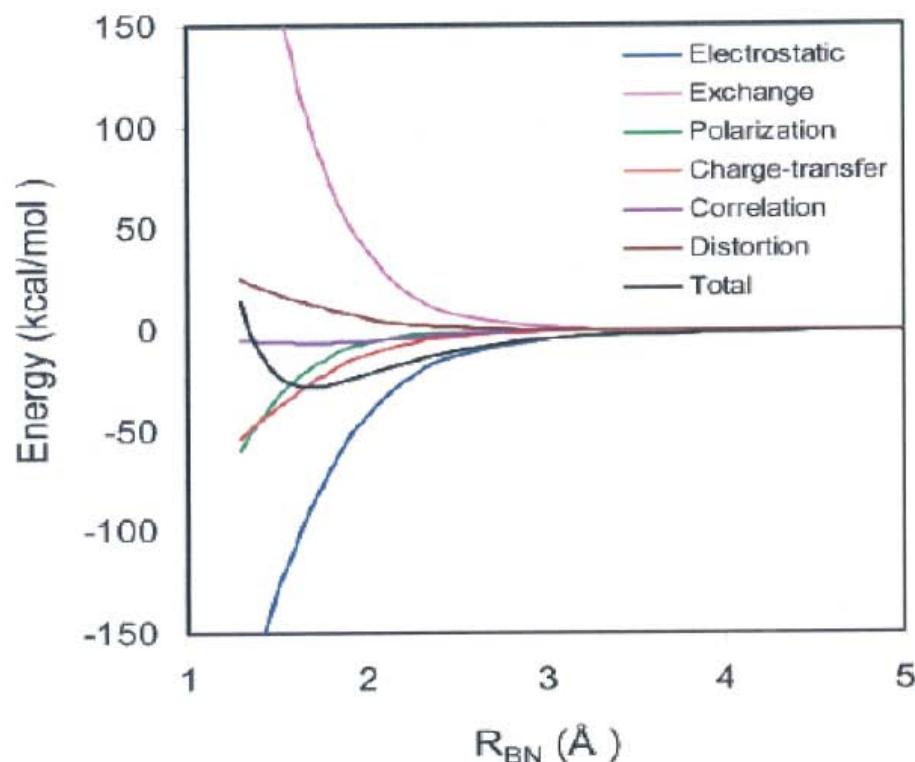

Intermolecular Interaction in Donor-Acceptor Complexes

$$\Delta E_{\text{int}} = \Delta E_{\text{es}} + \Delta E_{\text{ex}} + \Delta E_{\text{pol}} + \Delta E_{\text{ct}} + \Delta E_{\text{c}} + \Delta E_{\text{dist}}$$

Interaction = Electrostatic + Exchange Repulsion + Polarization
+ Charge Transfer + Correlation + Geometry Distortion

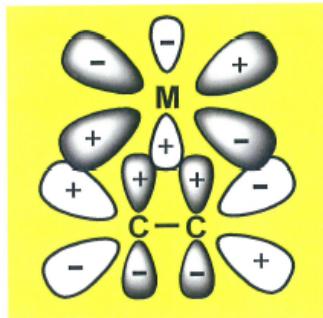

'Why d-Block Transition Metals ?

Two Major Reasons (#1)

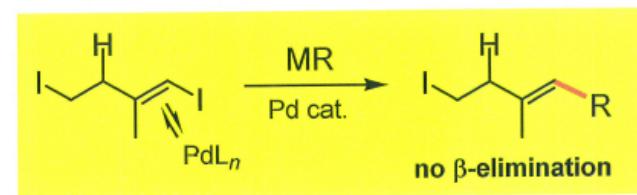

I. Simultaneous Availability of Empty and Filled Non-bonding Orbitals (LUMOs and HOMOs)

Note 1: Strong Affinity toward π -Bonds Explained and Expected.

Note 2: Highly Reactive and yet Stable, and Reversible. ("Super-Carbenoidal")

- M. J. S. Dewar
- K. Fukui
- R. Hoffmann
- R. B. Woodward

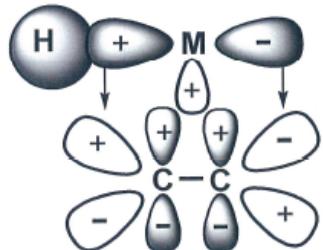

Note: This has been applied to 1,5-diene synthesis as detailed later.

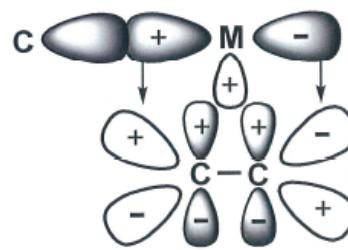

Note 3: Non-bonding Orbitals can be substituted with σ -Orbitals ("Elemento-metalation")

(These are available to main group metals as well. The only key requirement --- an empty orbital.)

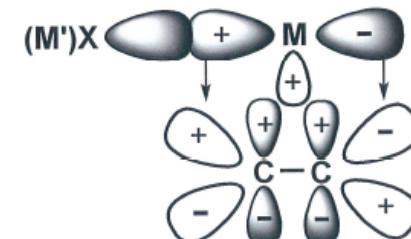

Hydrometalation

Carbometalation

Hetero(Metalloc)metalation

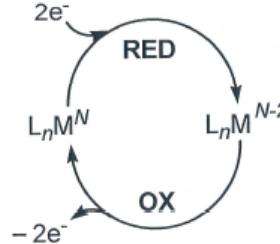

The significance of **concerted synergistic** (HOMO-LUMO & HOMO-LUMO) bonding cannot be overemphasized.

Why d-Block Transition Metals ?

Two Major Reasons (#2)

II. Ready and Reversible Reduction and Oxidation under One Set of Reaction Conditions !

- Essential to REDOX Catalysis
- Very difficult to devise REDOX Catalysis without using transition metals.

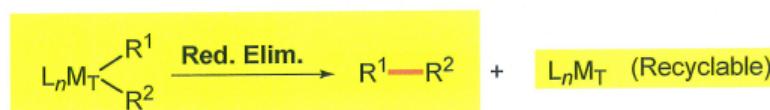

Four Basic Processes of C-C (and C-X) Bond Formation with Transition Metals

(1) Reductive Elimination

Ex. Pd- or Ni-cat. cross-coupling

(LEGO Game Approach)

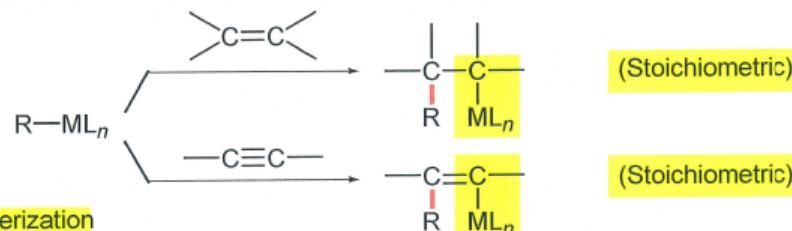

(2) Carbometalation^{a,b}

Ex. • Ziegler-Natta polymerization

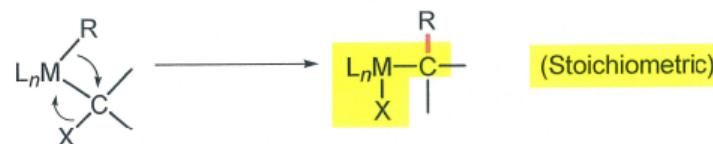

• Reppe and Wilke alkyne- and diene cyclooligomerization

• Olefin metathesis

(3) Migratory Insertion^{a,b}

Ex. Oxo and other carbonylation reactions

(4) Nucleophilic and Electrophilic Attack on Ligands^a

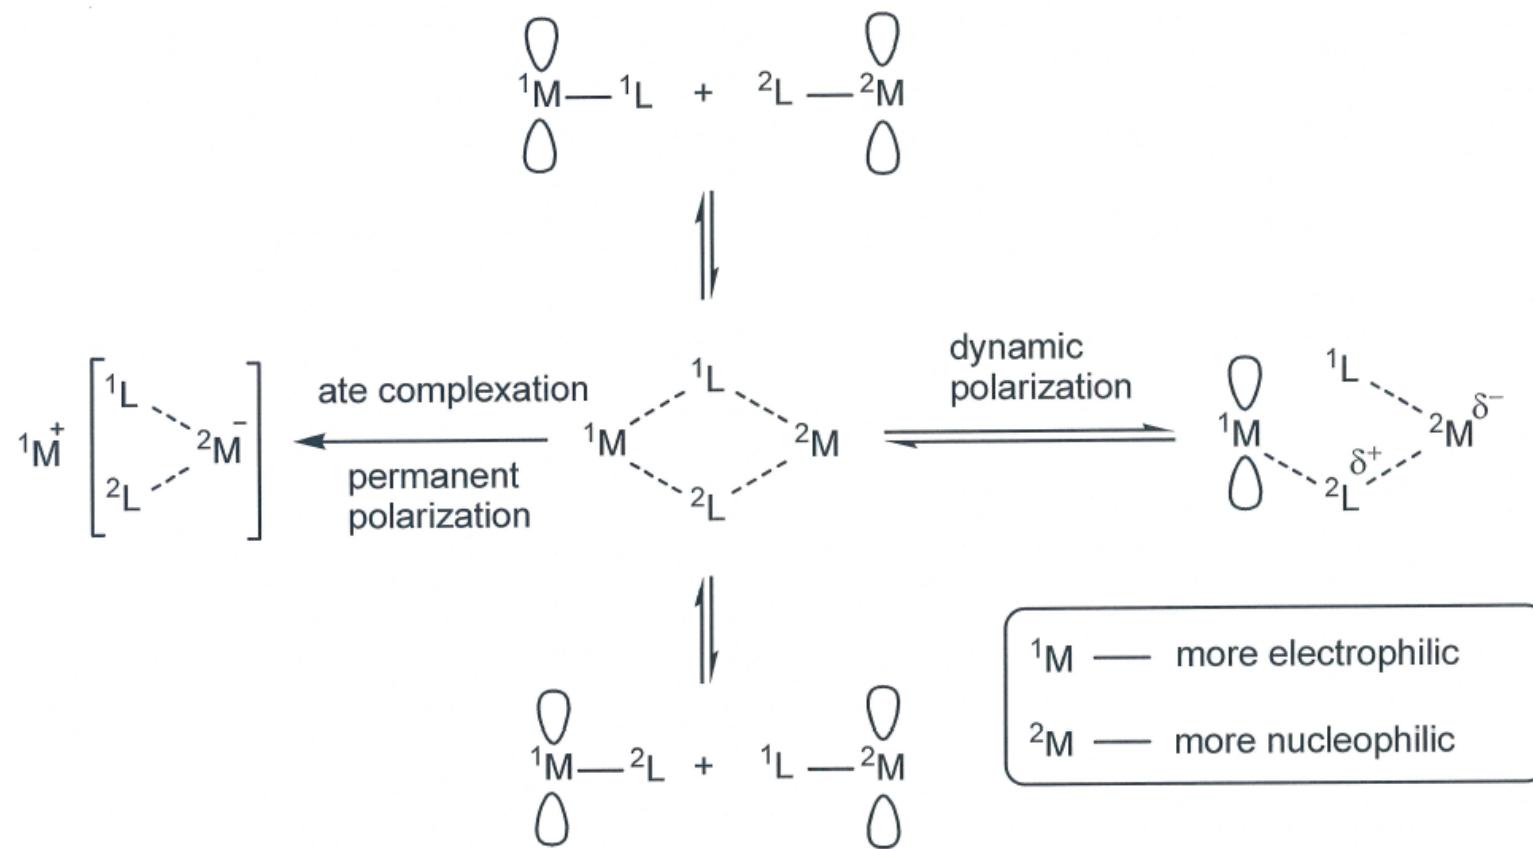

Ex. • Wacker oxidation

• Tsuji-Trost reaction

Note: (a) Missing links must be provided for catalysis.

(b) Main group metals also work but not catalytically.

Interactions between Two Coordinatively Unsaturated Metal Species

Bottom line: Two is better than one

Genealogy of Pd-Catalyzed Cross-Coupling

Several Independent Discoveries(1975-1979)

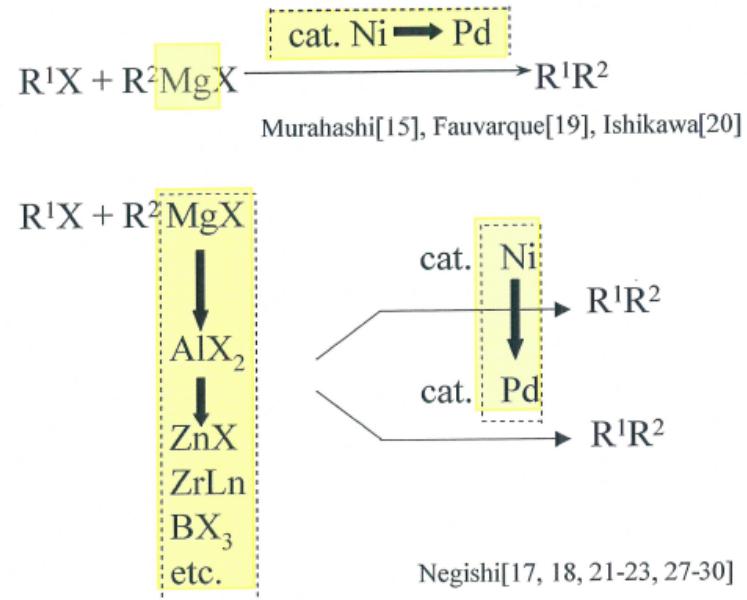

Mg: S. I. Murahashi, N. Ishikawa, J. F. Fauvarque (1975 & 1976)
(Following Mg-Ni version of Tamao, Kumada and Corriu, 1972)

Al, Zn, Zr: E. Negishi (1976-1977)

B: E. Negishi (1978) → A. Suzuki (1979)

Sn: M. Kosugi (1977) → J. K. Stille (1978)

Other metals: **Li, Na, K, Cu, In, Si, Mn**

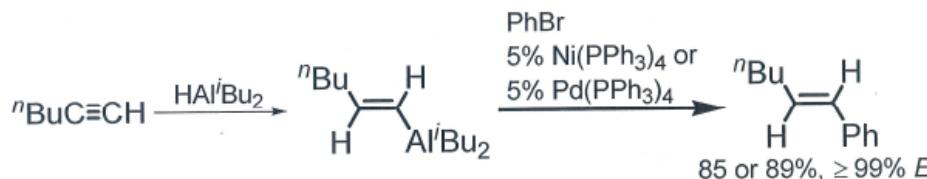

Negishi[17, 18, 21-23, 27-30]

Negishi group contributions:

1. Co-discovery of Pd-Catalyzed Cross-Coupling
2. Discovery of Al, B, Zn, Zr, etc. as Effective Metal Countercations
3. Discovery of Hydrometallation—Cross-Coupling & Carbometallation—Cross-Coupling Tandem Reactions
4. Discovery of Double Metal Catalysis, especially with ZnX₂

- Negishi, E., Ed., *Handbook of Organopalladium Chemistry for Organic Synthesis* **2002**, Wiley, Part III, pp 285-1119.

First Highly Selective and General Pd-catalyzed Cross-Coupling Route to Conjugated Dienes (1976-1979)

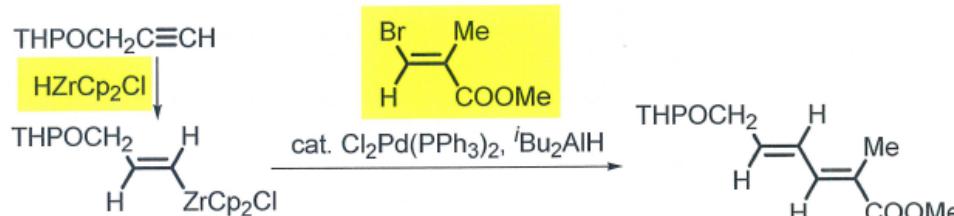

E. Negishi and S. Baba *CC* 1976, 596.

- Pd was used, but no advantage over Ni revealed.
- First Al – Ni or Al – Pd reaction.
- First hydrometallation – cross-coupling tandem process.

S. Baba and E. Negishi *JACS* 1976, 98, 6729.

- First highly ($>98\%$) selective and general synthesis of conjugated 1,3-dienes.
- Some distinct advantages of Pd over Ni in cross-coupling shown for the first time.
- First Zr – Ni or Zr – Pd reaction

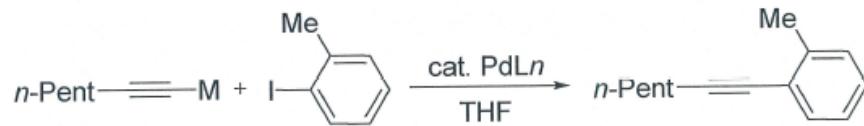

E. Negishi and D. E. Van Horn *JACS* 1977, 99, 3168.

E. Negishi et al. *TL* 1978, 19, 1027.

Bottom Line: (a) Superior selectivity associated with Pd over Ni reported for the first time.
(b) Discovery of the hydrometallation–cross-coupling tandem process.

SELECTIVE CARBON-CARBON BOND FORMATION *via* TRANSITION METAL

CATALYSIS: IS NICKEL OR PALLADIUM BETTER THAN COPPER?

Ei-ichi Negishi

Department of Chemistry, Syracuse University

Syracuse, New York 13210

[I wish to dedicate this paper to my former mentor, Professor H. C. Brown of Purdue University, on the occasion of his 66th birthday.]

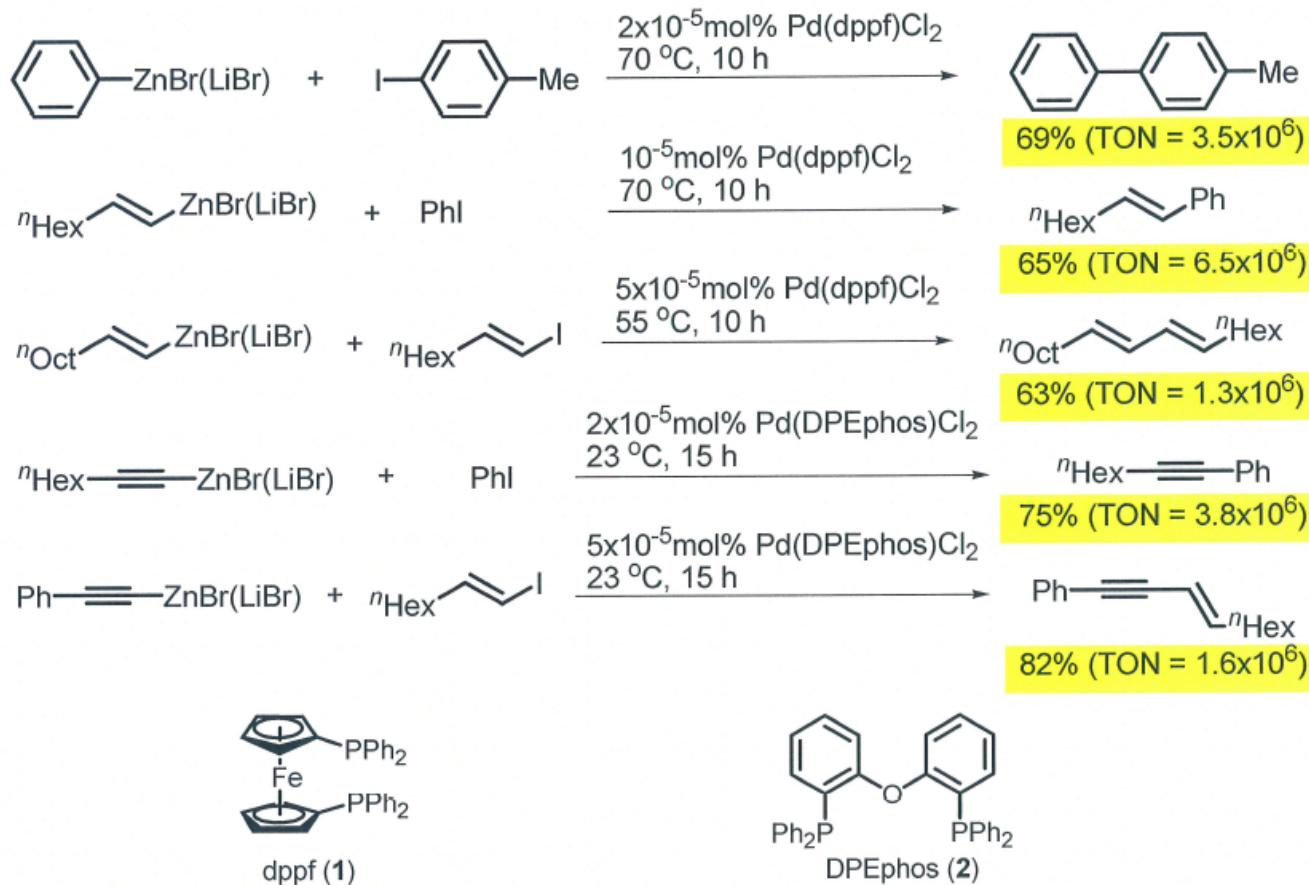

INTRODUCTION

The cross-coupling reaction involving the interaction of organometallic species, such as those containing lithium and magnesium, with organic halides and related electrophilic derivatives represents one of the most straightforward methods of carbon-carbon bond formation (eq 1).

Despite its inherent simplicity, however, its synthetic utility had been rather limited until the mid-1960s, due to various complications, such as competitive elimination and halogen-metal exchange reactions and the general lack of chemoselectivity.

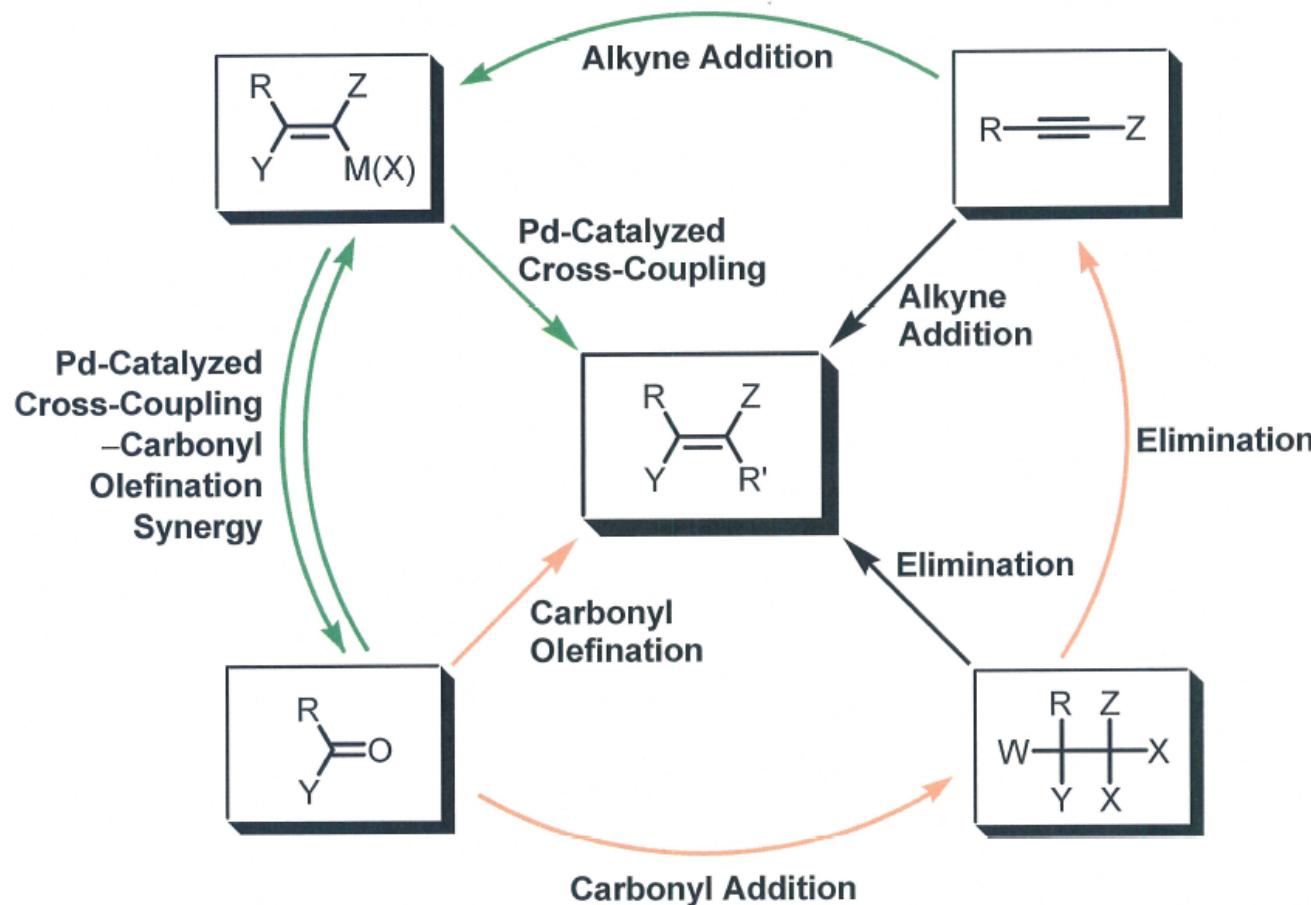

High Turnover Numbers Observed in the Pd-Catalyzed Cross-Coupling with Pd(dppf)Cl₂ or Pd(DPEphos)Cl₂ as a Catalyst

Bottom Line: Use of Zn and chelating ligands can lead to very high TONs.

How to Synthesize any Alkenes* Efficiently and Selectively

*Mostly acyclic alkenes considered.

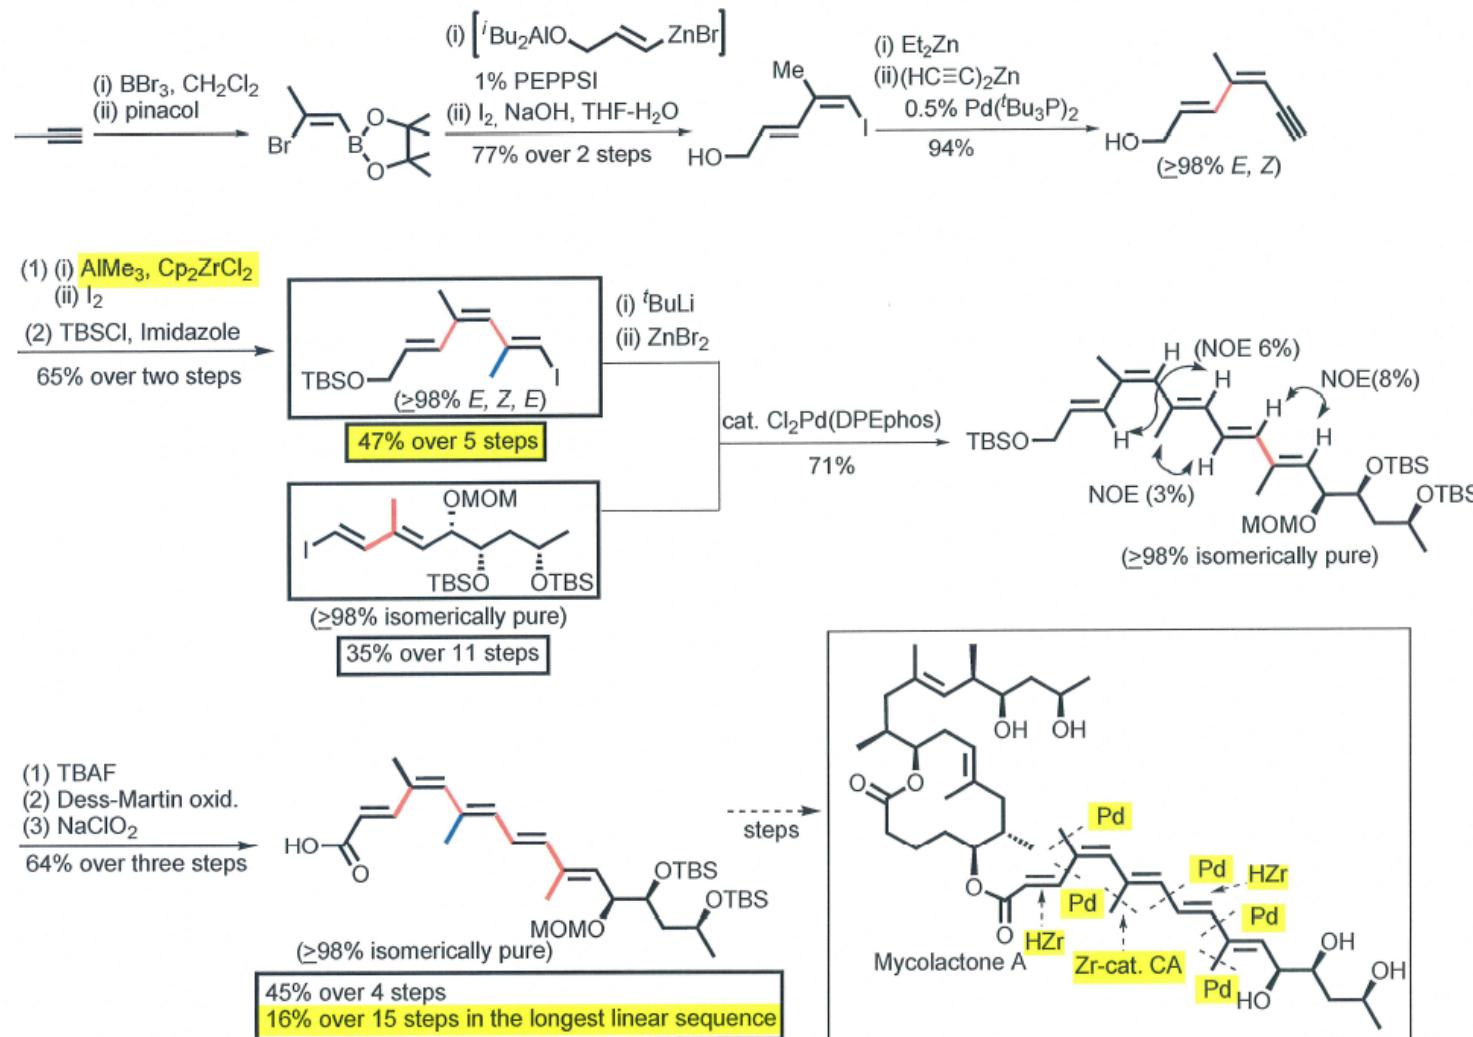

$R, R' = C$ or H . $M = \text{Metal}$. $W, X, Y, Z = H, C, \text{Halogen}, \text{Metal}, \text{and other Heteroatoms}$.

It takes Alkynes to make a world.
